

Implicit Surface Reconstruction

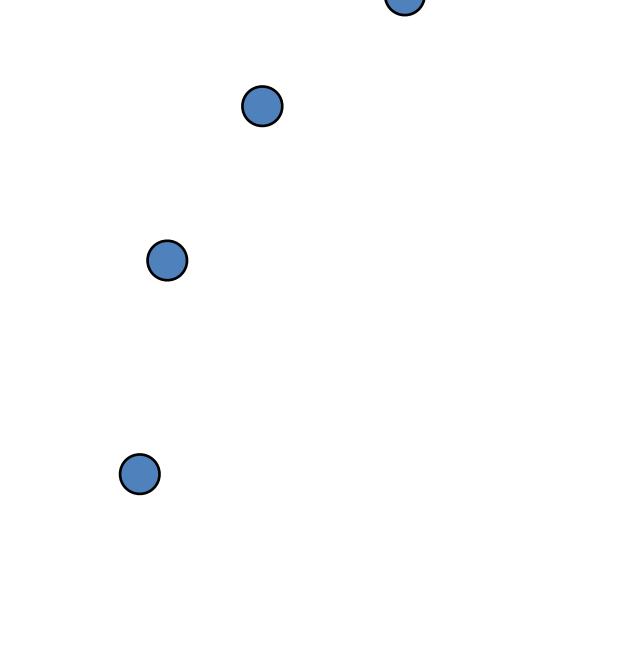

• Implicit function from point clouds

Need consistently oriented normals

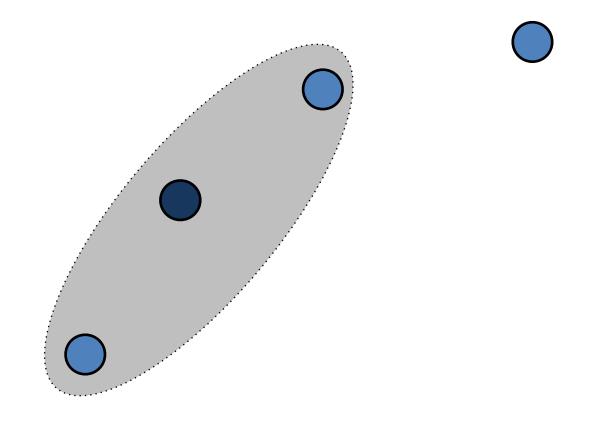

- Assign a normal vector **n** at each point cloud
 point **x**
 - Estimate the direction by fitting a local plane
 - Find consistent global orientation by propagation (spanning tree)

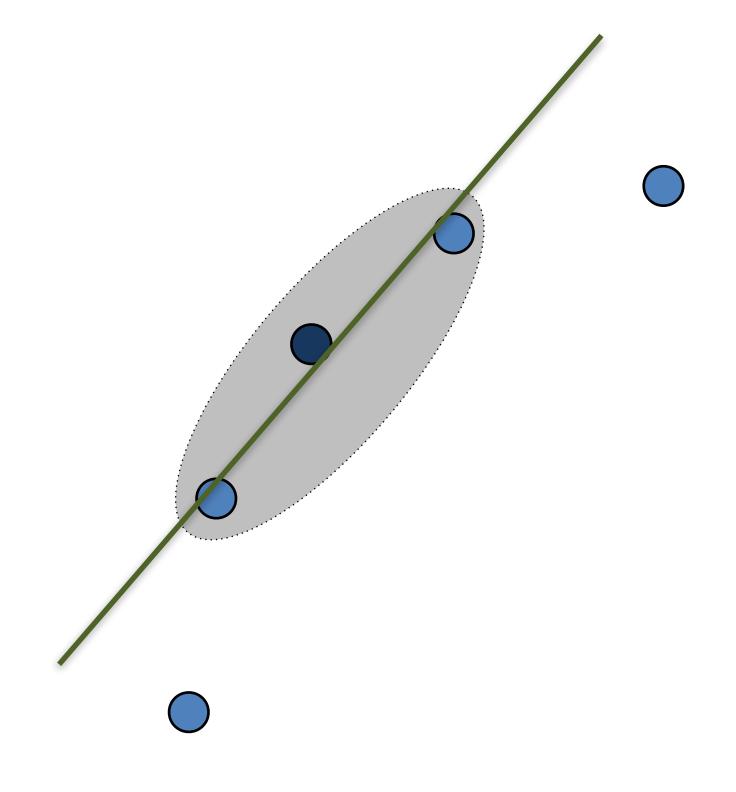

- Assign a normal vector **n** at each point cloud
 point **x**
 - Estimate the direction by fitting a local plane
 - Find consistent global orientation by propagation (spanning tree)

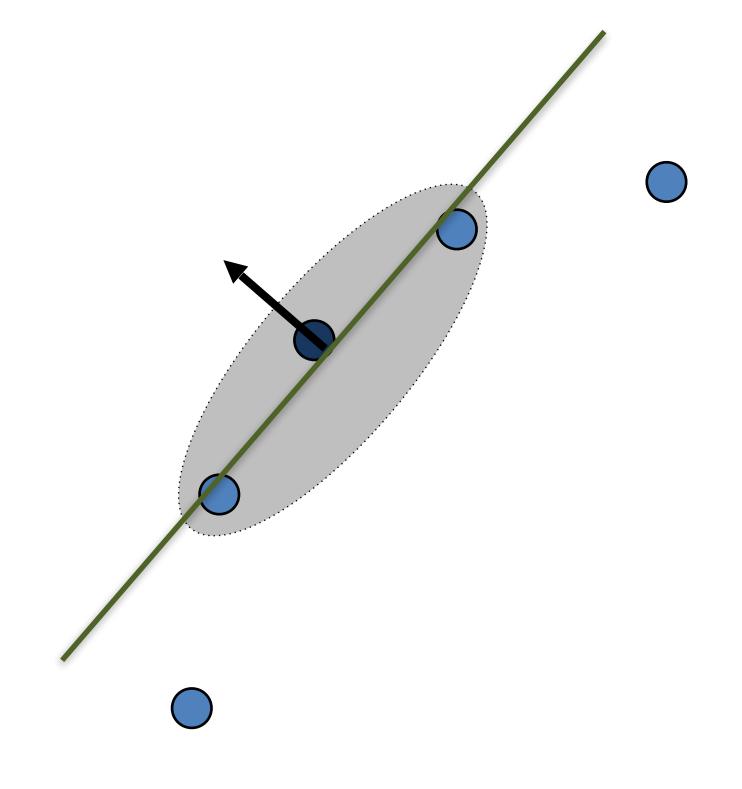

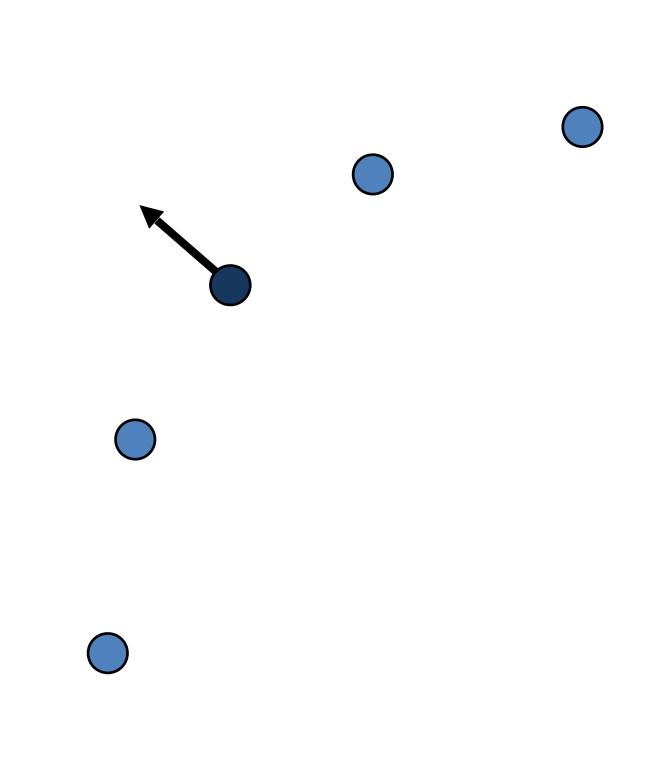

- Assign a normal vector **n** at each point cloud
 point **x**
 - Estimate the direction by fitting a local plane
 - Find consistent global orientation by propagation (spanning tree)

- Assign a normal vector **n** at each point cloud
 point **x**
 - Estimate the direction by fitting a local plane
 - Find consistent global orientation by propagation (spanning tree)

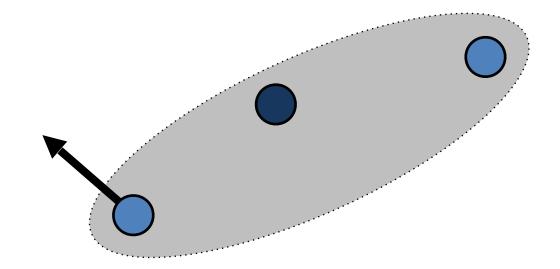

- Assign a normal vector **n** at each point cloud
 point **x**
 - Estimate the direction by fitting a local plane
 - Find consistent global orientation by propagation (spanning tree)

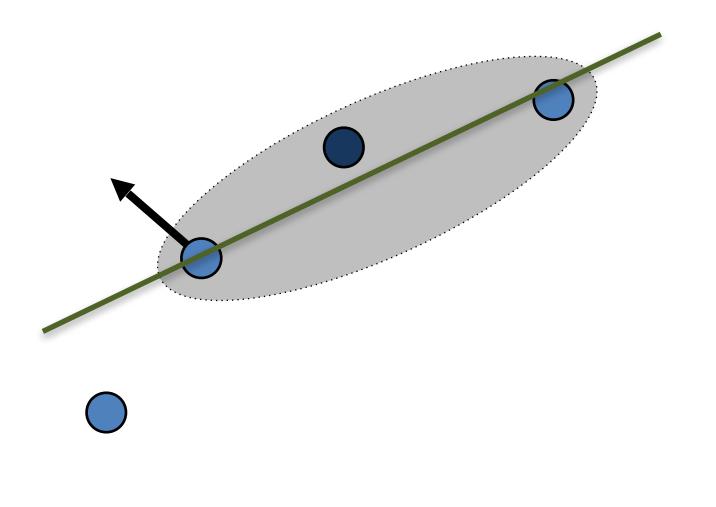

- Assign a normal vector **n** at each point cloud
 point **x**
 - Estimate the direction by fitting a local plane
 - Find consistent global orientation by propagation (spanning tree)

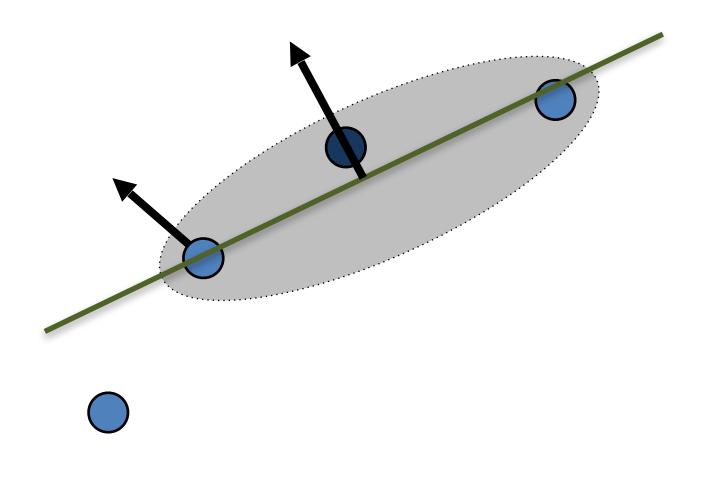

- Assign a normal vector **n** at each point cloud
 point **x**
 - Estimate the direction by fitting a local plane
 - Find consistent global orientation by propagation (spanning tree)

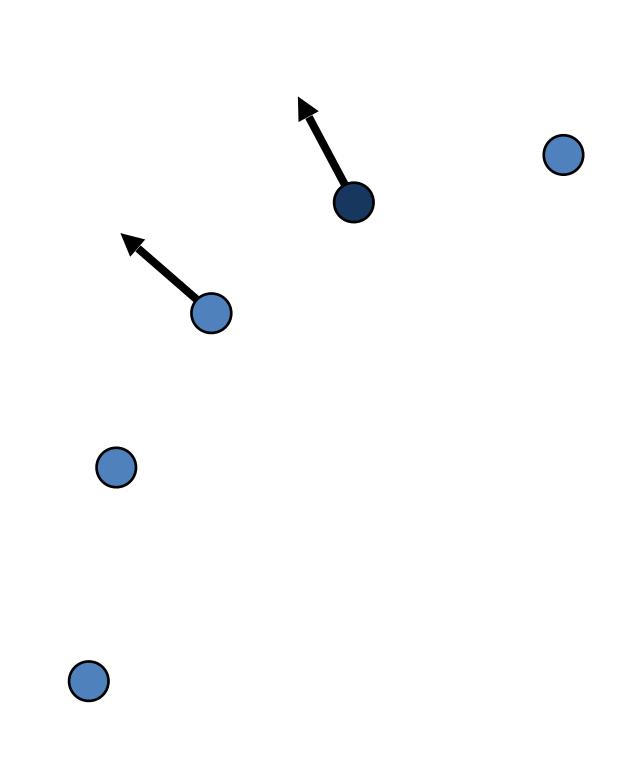

- Assign a normal vector **n** at each point cloud
 point **x**
 - Estimate the direction by fitting a local plane
 - Find consistent global orientation by propagation (spanning tree)

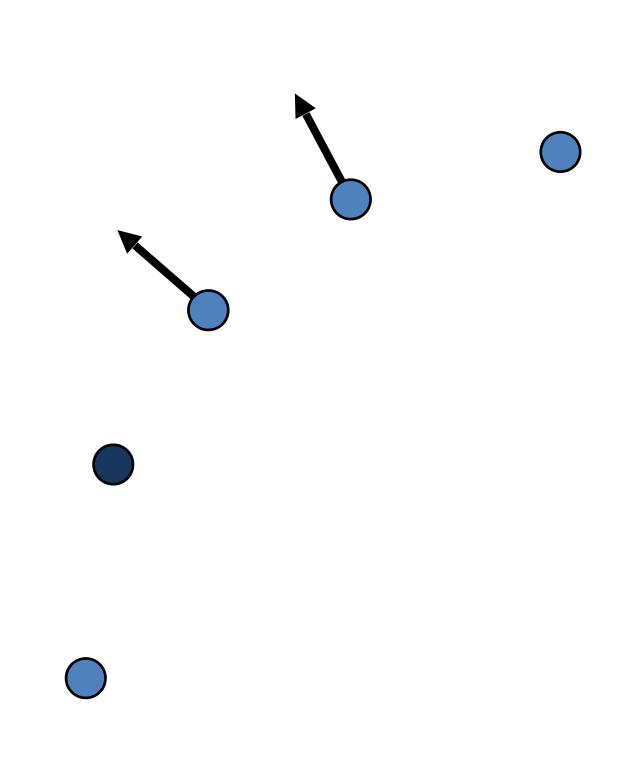

- Assign a normal vector **n** at each point cloud
 point **x**
 - Estimate the direction by fitting a local plane
 - Find consistent global orientation by propagation (spanning tree)

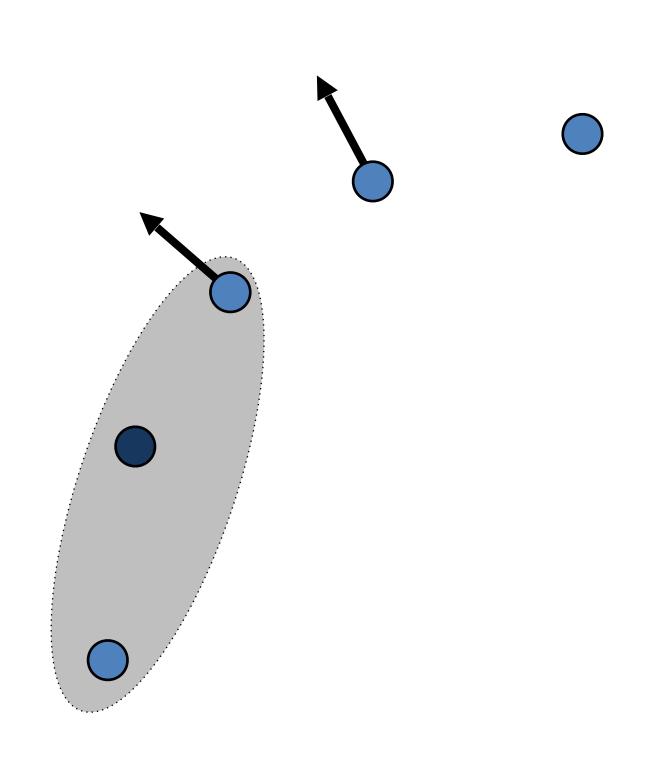

- Assign a normal vector **n** at each point cloud
 point **x**
 - Estimate the direction by fitting a local plane
 - Find consistent global orientation by propagation (spanning tree)

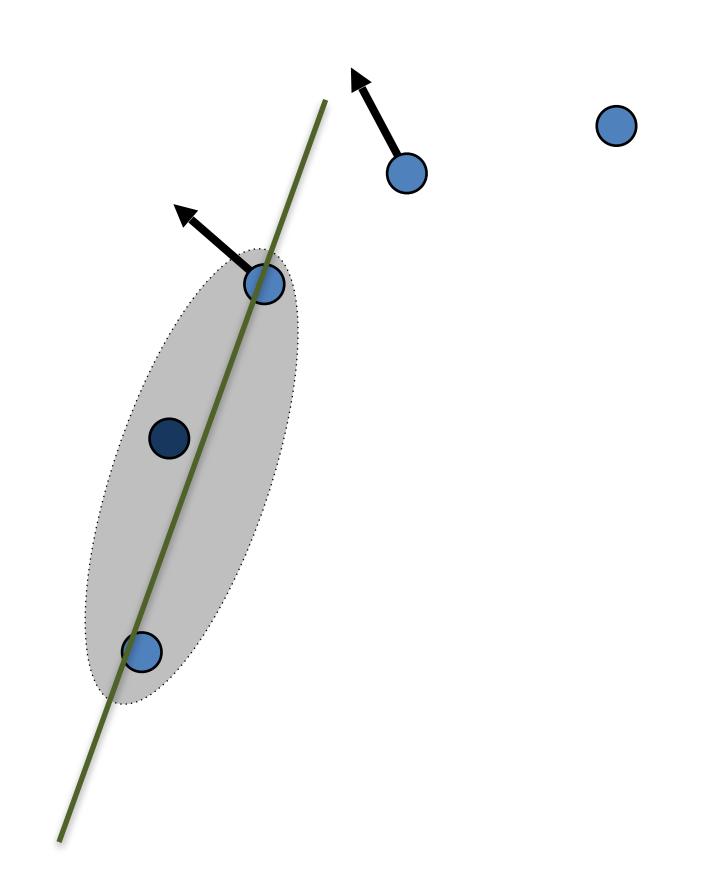

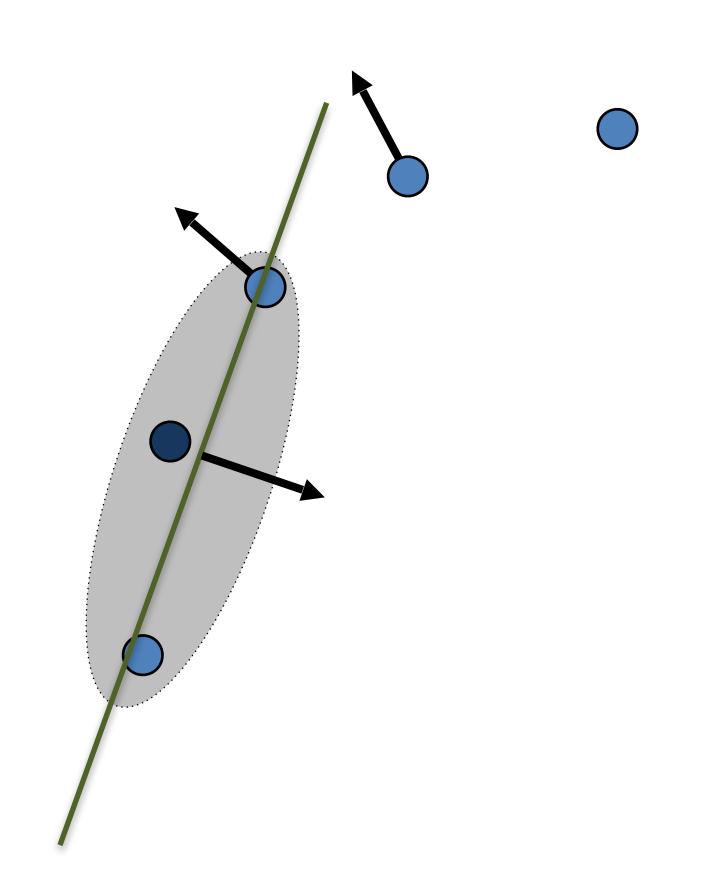

- Assign a normal vector **n** at each point cloud
 point **x**
 - Estimate the direction by fitting a local plane
 - Find consistent global orientation by propagation (spanning tree)

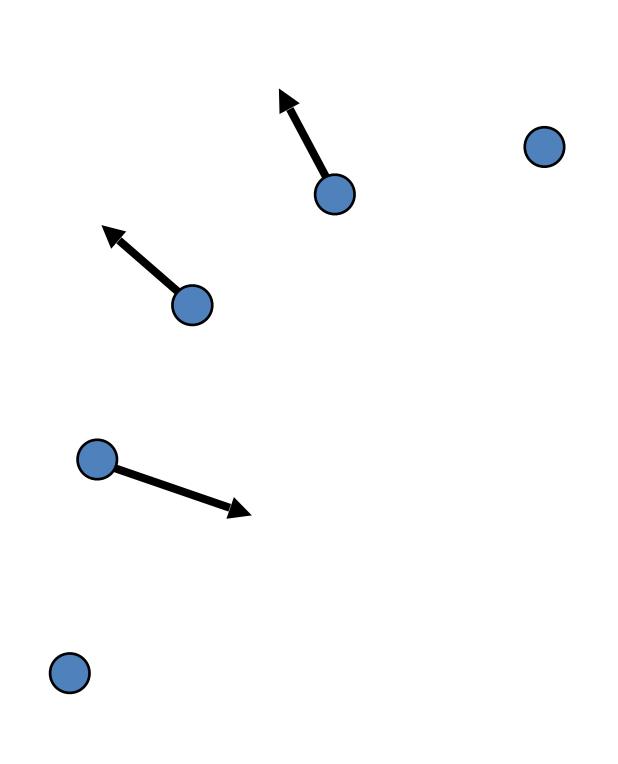

- Assign a normal vector **n** at each point cloud
 point **x**
 - Estimate the direction by fitting a local plane
 - Find consistent global orientation by propagation (spanning tree)

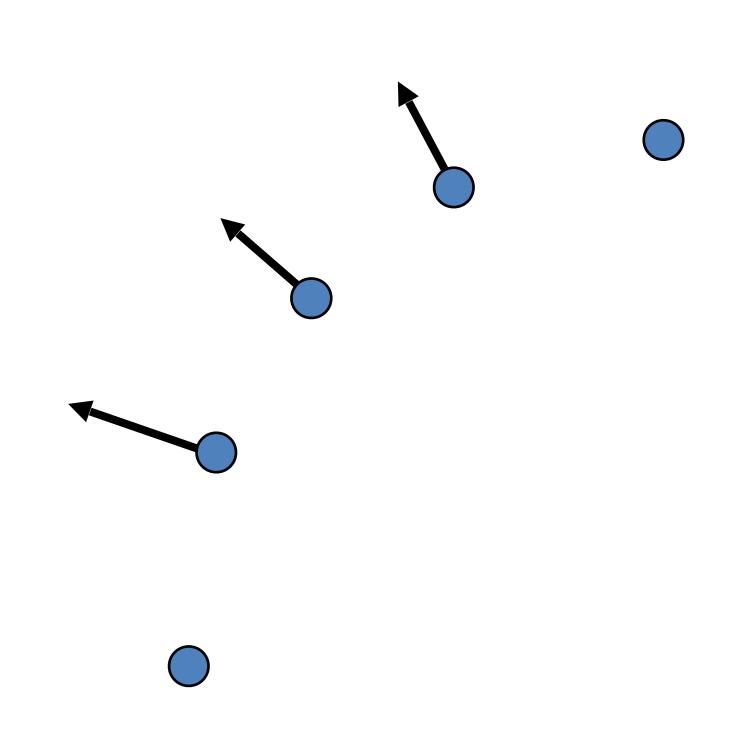

- Assign a normal vector **n** at each point cloud
 point **x**
 - Estimate the direction by fitting a local plane
 - Find consistent global orientation by propagation (spanning tree)

- Assign a normal vector **n** at each point cloud
 point **x**
 - Estimate the direction by fitting a local plane
 - Find consistent global orientation by propagation (spanning tree)

- Assign a normal vector **n** at each point cloud
 point **x**
 - Estimate the direction by fitting a local plane
 - Find consistent global orientation by propagation (spanning tree)

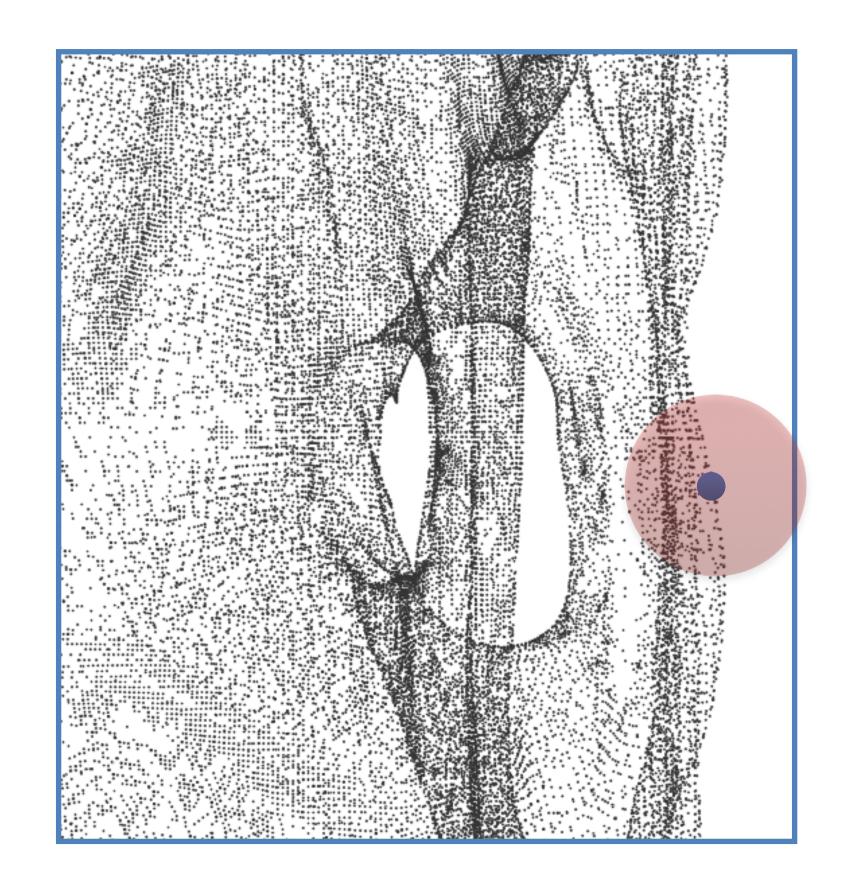

Local Plane Fitting

• For each point \mathbf{x} in the cloud, pick k nearest neighbors or all points in r-ball: $\{\mathbf{x}_i \mid ||\mathbf{x}_i - \mathbf{x}|| < r\}$

$$\mathbf{x}_1, \mathbf{x}_2, \dots, \mathbf{x}_n$$

• Find a plane Π that minimizes the sum of square distances:

$$\min \sum_{i=1}^{n} \operatorname{dist}(\mathbf{x}_i, \Pi)^2$$

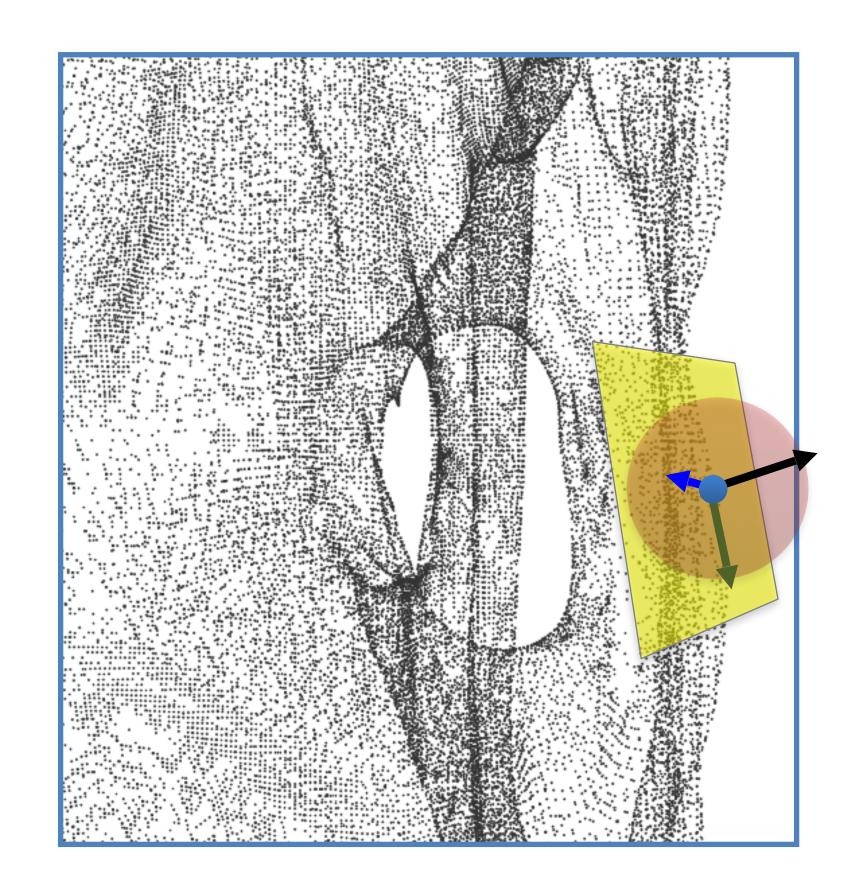

Local Plane Fitting

• For each point \mathbf{x} in the cloud, pick k nearest neighbors or all points in r-ball: $\{\mathbf{x}_i \mid ||\mathbf{x}_i - \mathbf{x}|| < r\}$

$$\mathbf{x}_1, \mathbf{x}_2, \dots, \mathbf{x}_n$$

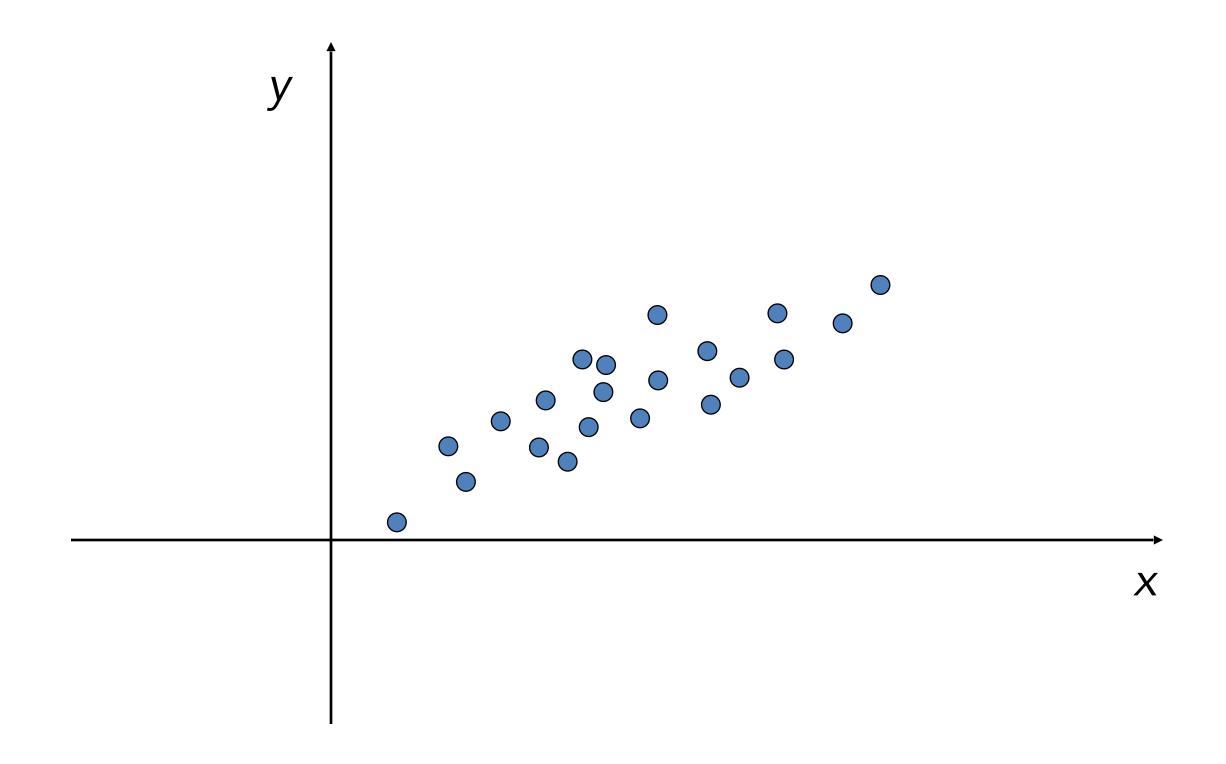

• Find a plane Π that minimizes the sum of square distances:

$$\min \sum_{i=1}^{n} \operatorname{dist}(\mathbf{x}_i, \Pi)^2$$

Linear Least Squares?

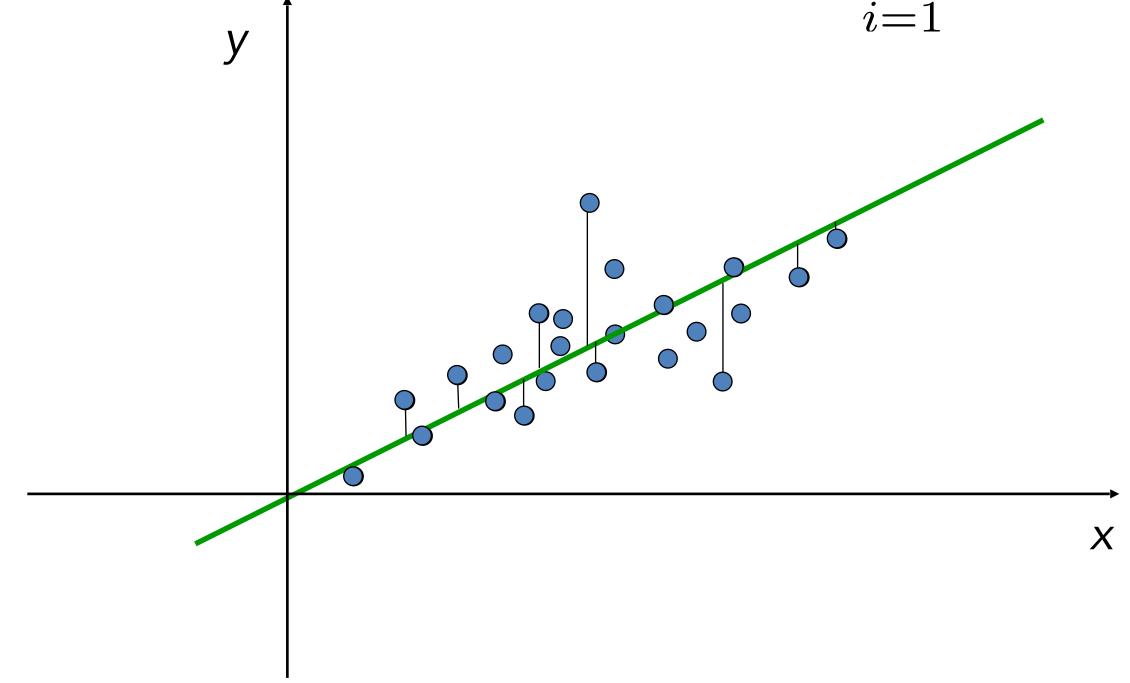

Linear Least Squares?

• Find a line y = ax + b s.t.

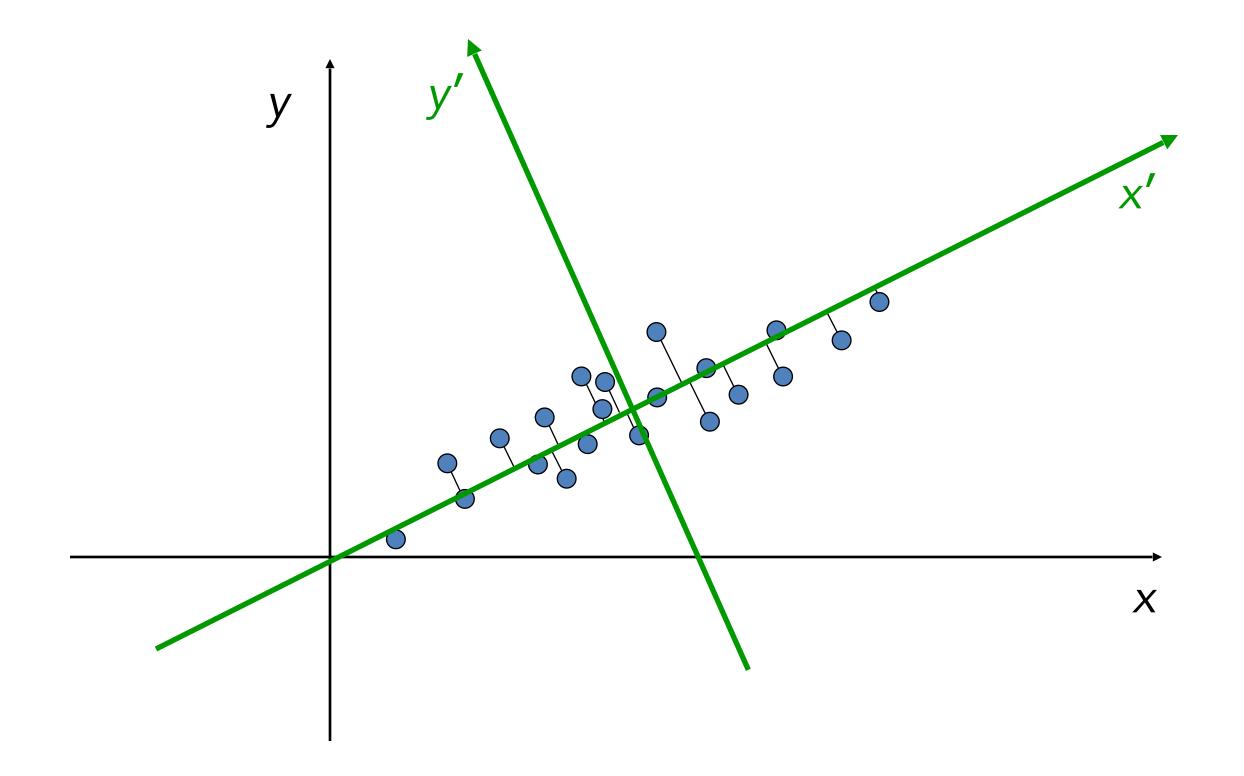

$$\min \sum_{i=1}^{n} (y_i - (ax_i + b))^2$$

• But we would like true orthogonal distances!

Best Fit with SSD

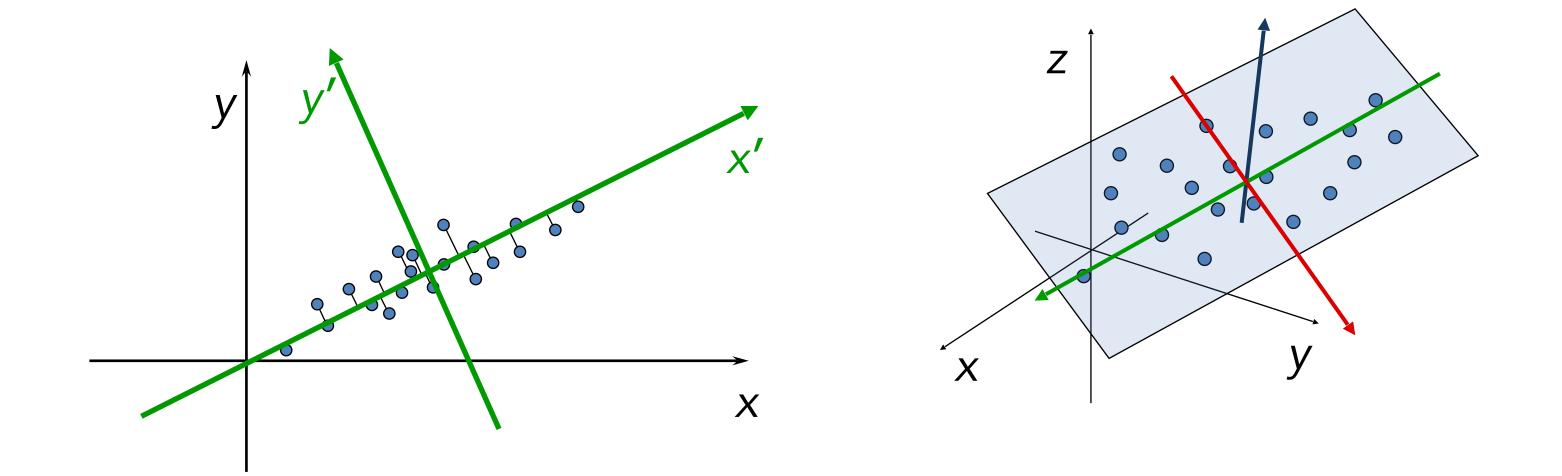

SSD = sum of squared distances (or differences)

Principle Component Analysis (PCA)

PCA finds an orthogonal basis that best represents a given data set

• PCA finds the best approximating line/plane/orientation... (in terms of Σ distances²)

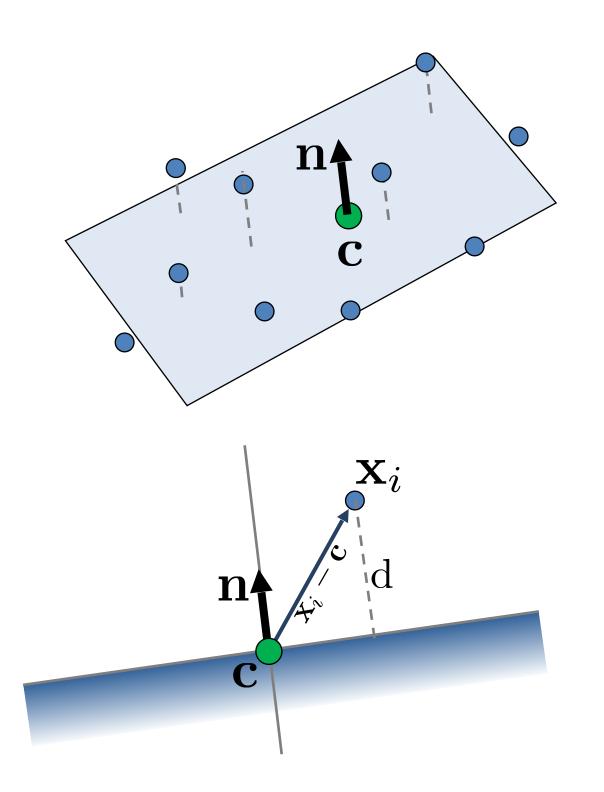

Notations

• Input points:

$$\mathbf{x}_1, \mathbf{x}_2, \dots, \mathbf{x}_n \in \mathbb{R}^d$$

 Looking for a (hyper) plane passing through c with normal n s.t.

$$\min_{\mathbf{c},\mathbf{n},\|\mathbf{n}\|=1} \sum_{i=1}^{n} \left((\mathbf{x}_i - \mathbf{c})^T \mathbf{n} \right)^2$$

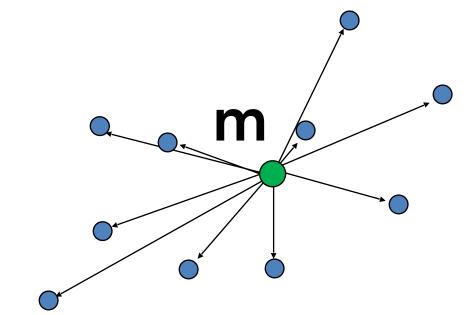

Notations

Input points:

$$\mathbf{x}_1, \mathbf{x}_2, \dots, \mathbf{x}_n \in \mathbb{R}^d$$

• Centroid:

$$\mathbf{m} = \frac{1}{n} \sum_{i=1}^{n} \mathbf{x}_i$$

Vectors from the centroid:

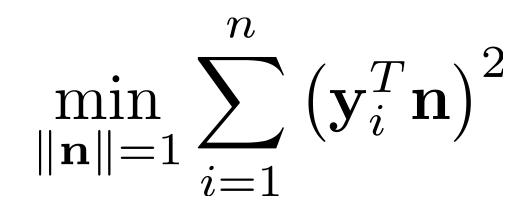

$$\mathbf{y}_i = \mathbf{x}_i - \mathbf{m}$$

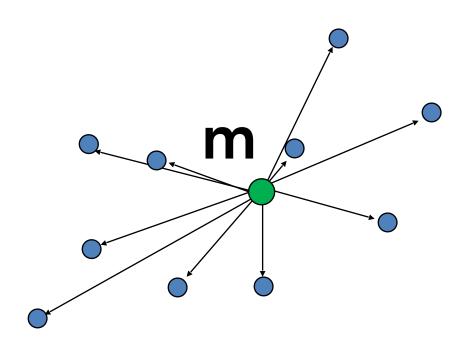

Centroid: 0-dim Approximation

• It can be shown that:

$$\mathbf{m} = \underset{\mathbf{c}}{\operatorname{argmin}} \sum_{i=1}^{n} \left((\mathbf{x}_i - \mathbf{c})^T \mathbf{n} \right)^2$$
 $\mathbf{m} = \underset{\mathbf{c}}{\operatorname{argmin}} \sum_{i=1}^{n} \|\mathbf{x}_i - \mathbf{c}\|^2$

- m minimizes SSD
- m will be the origin of the (hyper)-plane
- Our problem becomes:

$$\mathbf{m} = \frac{1}{n} \sum_{i=1}^{n} \mathbf{x}_i$$

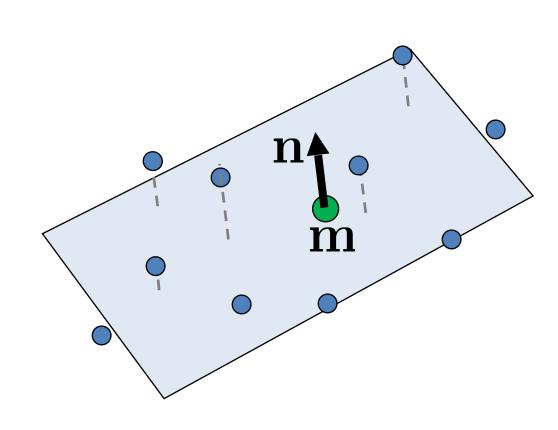

Minimize!

$$\min_{\mathbf{n}^T \mathbf{n} = 1} \sum_{i=1}^n (\mathbf{y}_i^T \mathbf{n})^2 = \min_{\mathbf{n}^T \mathbf{n} = 1} \sum_{i=1}^n \mathbf{n}^T \mathbf{y}_i \mathbf{y}_i^T \mathbf{n} =$$

$$\min_{\mathbf{n}^T \mathbf{n} = 1} \mathbf{n}^T \left(\sum_{i=1}^n \mathbf{y}_i \mathbf{y}_i^T \right) \mathbf{n} = \min_{\mathbf{n}^T \mathbf{n} = 1} \mathbf{n}^T \left(\mathbf{Y} \mathbf{Y}^T \right) \mathbf{n}$$

$$\mathbf{Y} = \begin{pmatrix} | & | & | \\ \mathbf{y}_1 & \mathbf{y}_2 & \dots & \mathbf{y}_n \\ | & | & | \end{pmatrix}$$

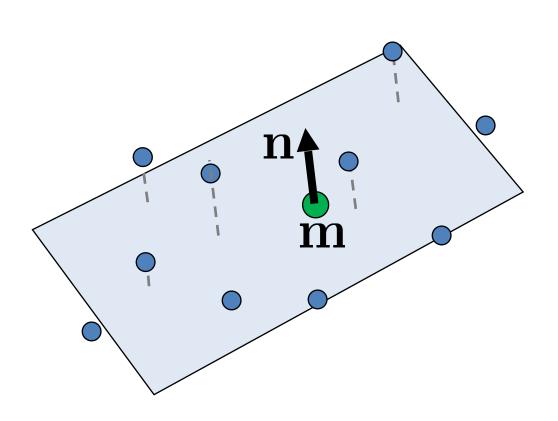

Minimize!

$$\min_{\mathbf{n}^T \mathbf{n} = 1} \sum_{i=1}^{n} (\mathbf{y}_i^T \mathbf{n})^2 = \min_{\mathbf{n}^T \mathbf{n} = 1} \sum_{i=1}^{n} \mathbf{n}^T \mathbf{y}_i \mathbf{y}_i^T \mathbf{n} =$$

$$\min_{\mathbf{n}^T \mathbf{n} = 1} \mathbf{n}^T \left(\sum_{i=1}^{n} \mathbf{y}_i \mathbf{y}_i^T \right) \mathbf{n} = \min_{\mathbf{n}^T \mathbf{n} = 1} \mathbf{n}^T \left(\mathbf{Y} \mathbf{Y}^T \right) \mathbf{n}$$

$$\mathbf{Y} = \begin{pmatrix} | & | & | \\ \mathbf{y}_1 & \mathbf{y}_2 & \dots & \mathbf{y}_n \\ | & | & | \end{pmatrix}$$

$$f(\mathbf{n}) = \mathbf{n}^T \mathbf{S} \mathbf{n}$$
 $(\mathbf{S} = \mathbf{Y} \mathbf{Y}^T)$
 $\min f(\mathbf{n})$ s.t. $\mathbf{n}^T \mathbf{n} = 1$

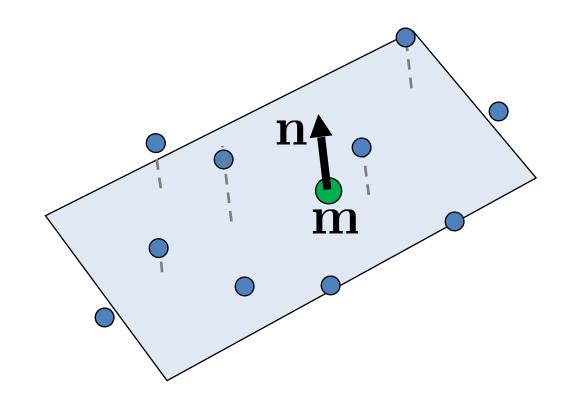

Constrained minimization – Lagrange multipliers

$$f(\mathbf{n}) = \mathbf{n}^T \mathbf{S} \mathbf{n}$$
 $(\mathbf{S} = \mathbf{Y} \mathbf{Y}^T)$
 $\min f(\mathbf{n})$ $s.t.$ $\mathbf{n}^T \mathbf{n} = 1$

$$\mathcal{L}(\mathbf{n}, \lambda) = f(\mathbf{n}) - \lambda(\mathbf{n}^T \mathbf{n} - 1)$$
$$\nabla \mathcal{L} = 0$$

$$\frac{\partial \mathcal{L}}{\partial \mathbf{n}} = \frac{\partial}{\partial \mathbf{n}} f(\mathbf{n}) - \lambda \frac{\partial}{\partial \mathbf{n}} (\mathbf{n}^T \mathbf{n} - 1)$$
$$\frac{\partial \mathcal{L}}{\partial \lambda} = \mathbf{n}^T \mathbf{n} - 1$$

$$\frac{\partial}{\partial \mathbf{n}} f(\mathbf{n}) - \lambda \frac{\partial}{\partial \mathbf{n}} (\mathbf{n}^T \mathbf{n} - 1) = (\mathbf{S} + \mathbf{S}^T) \mathbf{n} - \lambda (\mathbf{I} + \mathbf{I}^T) \mathbf{n} = 2\mathbf{S} \mathbf{n} - 2\lambda \mathbf{n}$$

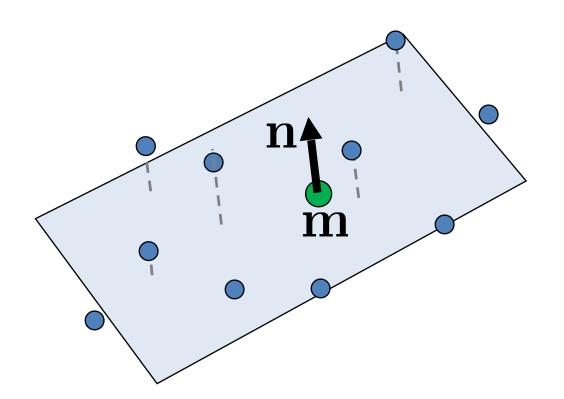

Constrained minimization – Lagrange multipliers

$$f(\mathbf{n}) = \mathbf{n}^T \mathbf{S} \mathbf{n}$$
 $(\mathbf{S} = \mathbf{Y} \mathbf{Y}^T)$
 $\min f(\mathbf{n})$ $s.t.$ $\mathbf{n}^T \mathbf{n} = 1$

$$\mathcal{L}(\mathbf{n}, \lambda) = f(\mathbf{n}) - \lambda(\mathbf{n}^T \mathbf{n} - 1)$$
$$\nabla \mathcal{L} = 0$$

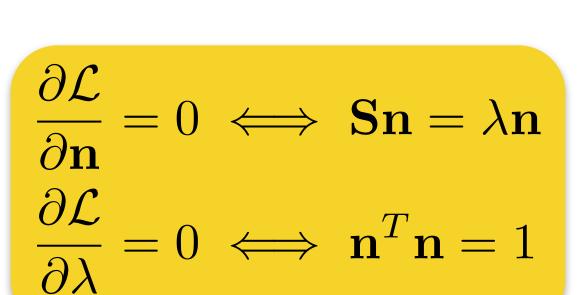

$$\frac{\partial \mathcal{L}}{\partial \mathbf{n}} = 0 \iff \mathbf{S}\mathbf{n} = \lambda \mathbf{n}$$
$$\frac{\partial \mathcal{L}}{\partial \lambda} = 0 \iff \mathbf{n}^T \mathbf{n} = 1$$

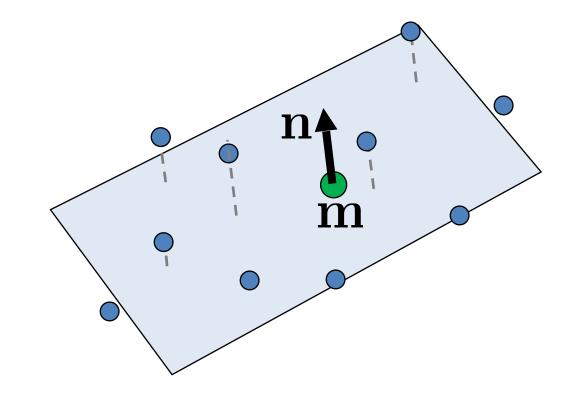

Constrained minimization – Lagrange multipliers

$$f(\mathbf{n}) = \mathbf{n}^T \mathbf{S} \mathbf{n}$$
 $(\mathbf{S} = \mathbf{Y} \mathbf{Y}^T)$
 $\min f(\mathbf{n})$ s.t. $\mathbf{n}^T \mathbf{n} = 1$

$$\mathcal{L}(\mathbf{n}, \lambda) = f(\mathbf{n}) - \lambda(\mathbf{n}^T \mathbf{n} - 1)$$
$$\nabla \mathcal{L} = 0$$

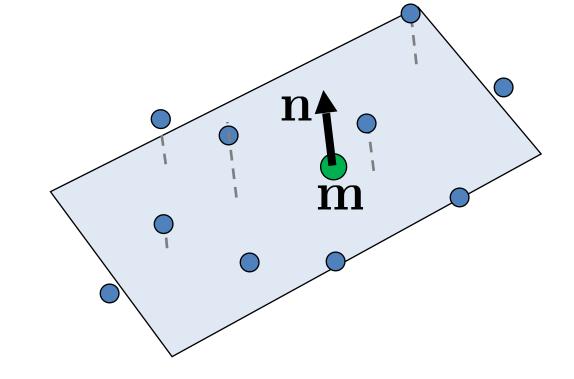

What can be said about **n** ??

• Constrained minimization – Lagrange multipliers

$$f(\mathbf{n}) = \mathbf{n}^T \mathbf{S} \mathbf{n}$$
 $(\mathbf{S} = \mathbf{Y} \mathbf{Y}^T)$
 $\min f(\mathbf{n})$ s.t. $\mathbf{n}^T \mathbf{n} = 1$

$$\mathcal{L}(\mathbf{n}, \lambda) = f(\mathbf{n}) - \lambda(\mathbf{n}^T \mathbf{n} - 1)$$
$$\nabla \mathcal{L} = 0$$

$$\frac{\partial \mathcal{L}}{\partial \mathbf{n}} = 0 \iff \mathbf{S}\mathbf{n} = \lambda \mathbf{n}$$
$$\frac{\partial \mathcal{L}}{\partial \lambda} = 0 \iff \mathbf{n}^T \mathbf{n} = 1$$

n is the eigenvector of **S** with the smallest eigenvalue

Summary – Best Fitting Plane Recipe

- Input: $\mathbf{x}_1, \mathbf{x}_2, \dots, \mathbf{x}_n \in \mathbb{R}^d$
- Compute centroid = plane origin $\mathbf{m} = \frac{1}{n} \sum_{i=1}^{n} \mathbf{x}_i$
- Compute scatter matrix $\mathbf{S} = \mathbf{Y}\mathbf{Y}^T$ $\mathbf{Y} = (\mathbf{y}_1 \ \mathbf{y}_2 \ \dots \ \mathbf{y}_n)$ $\mathbf{y}_i = \mathbf{x}_i \mathbf{m}$
- The plane normal **n** is the eigenvector of **S** with the smallest eigenvalue

$$\mathbf{S} = \mathbf{V} \begin{pmatrix} \lambda_1 & & \\ & \ddots & \\ & & \lambda_d \end{pmatrix} \mathbf{V}^T$$

What does the Scatter Matrix do?

• Let's look at a line l through the center of mass \mathbf{m} with direction vector \mathbf{v} , and project our points \mathbf{x}_i onto it. The variance of the projected points \mathbf{x}'_i is:

$$\operatorname{var}(\mathbf{x}_{1}, \dots \mathbf{x}_{n}; \mathbf{v}) = \frac{1}{n} \sum_{i=1}^{n} \|\mathbf{x}_{i}' - \mathbf{m}\|^{2} =$$

$$= \frac{1}{n} \sum_{i=1}^{n} \|(\mathbf{m} + \mathbf{v}^{T} \mathbf{y}_{i}) - \mathbf{m}\|^{2} = \frac{1}{n} \sum_{i=1}^{n} (\mathbf{y}_{i}^{T} \mathbf{v})^{2} = \frac{1}{n} \mathbf{v}^{T} \mathbf{S} \mathbf{v}$$

Original set

Small variance

Large variance

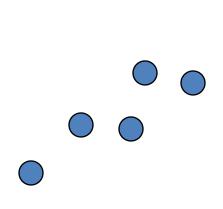

What does the Scatter Matrix do?

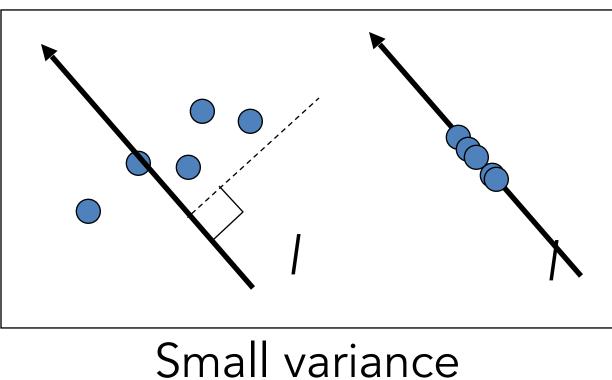

• The scatter matrix measures the variance of our data points along the direction ${\bf v}$

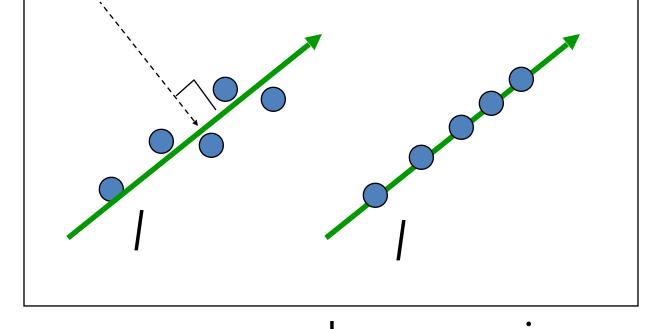

$$\operatorname{var}(\mathbf{x}_{1}, \dots \mathbf{x}_{n}; \mathbf{v}) = \frac{1}{n} \sum_{i=1}^{n} \|\mathbf{x}_{i}' - \mathbf{m}\|^{2} =$$

$$= \frac{1}{n} \sum_{i=1}^{n} \|(\mathbf{m} + \mathbf{v}^{T} \mathbf{y}_{i}) - \mathbf{m}\|^{2} = \frac{1}{n} \sum_{i=1}^{n} (\mathbf{y}_{i}^{T} \mathbf{v})^{2} = \frac{1}{n} \mathbf{v}^{T} \mathbf{S} \mathbf{v}$$

Original set

Large variance

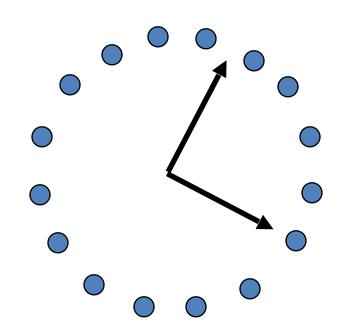

Principal Components

- Eigenvectors of **S** that correspond to big eigenvalues are the directions in which the data has strong components (= large variance).
- If the eigenvalues are more or less the same there is no preferable direction.

$$\mathbf{S} = \mathbf{V} egin{pmatrix} \lambda_1 & & & \ & \ddots & & \ & & \lambda_d \end{pmatrix} \mathbf{V}^T$$

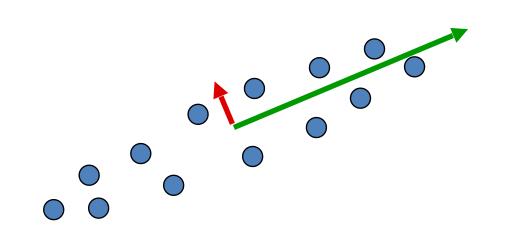

Principal Components

- There's no preferable direction
- S looks like this:

$$\mathbf{S} = \mathbf{V} \begin{pmatrix} \lambda & \\ & \lambda \end{pmatrix} \mathbf{V}^T$$

Any vector is an eigenvector

- There's a clear preferable direction
- S looks like this:

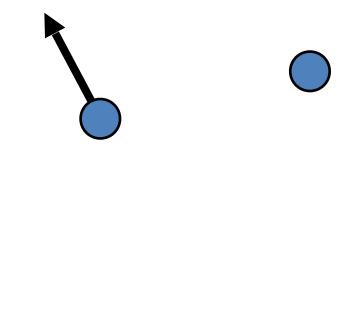

$$\mathbf{S} = \mathbf{V} \begin{pmatrix} \lambda & \\ & \mu \end{pmatrix} \mathbf{V}^T$$

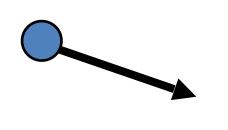

• μ is close to zero, much smaller than λ

Normal Orientation

- PCA may return arbitrarily oriented eigenvectors
- Wish to orient consistently
- Neighboring points should have similar normals

Normal Orientation

- Build graph connecting neighboring points
 - Edge (i,j) exists if $\mathbf{x}_i \in kNN(\mathbf{x}_j)$ or $\mathbf{x}_j \in kNN(\mathbf{x}_i)$
- Propagate normal orientation through graph
 - For neighbors \mathbf{x}_i , \mathbf{x}_j : Flip \mathbf{n}_j if $\mathbf{n}_i^T \mathbf{n}_j < 0$
 - Fails at sharp edges/corners
- Propagate along "safe" paths (parallel tangent planes)
 - Minimum spanning tree with angle-based edge weights $w_{ij} = 1 |\mathbf{n}_i^T \mathbf{n}_j|$

"Surface reconstruction from unorganized points", Hoppe et al., SIGGRAPH 1992 http://research.microsoft.com/en-us/um/people/hoppe/recon.pdf
